RUB

MOTIVATION

- Towards understanding the biological neural processes that give rise to the language competence

THEORETICAL STARTING POINT

- The language competence is “grounded” in perceptual-motor processes (Barsalou, 1999, 2008)
 - Makes use of these processes
 - Evolved “on top of” these processes

RESEARCH PROGRAM

- Build models of how the language competence may emerge from the neural principles postulated in DFT

RESEARCH PROGRAM

- Build models of how the language competence may emerge from the neural principles postulated in DFT
- ... possibly using and extending the same neural architectures as more primitive sensory-motor processes
 - Neural fields with their instabilities (detection, selection, short-term memory)
 - Visual search
 - Categorization
 - Coordinate transformations

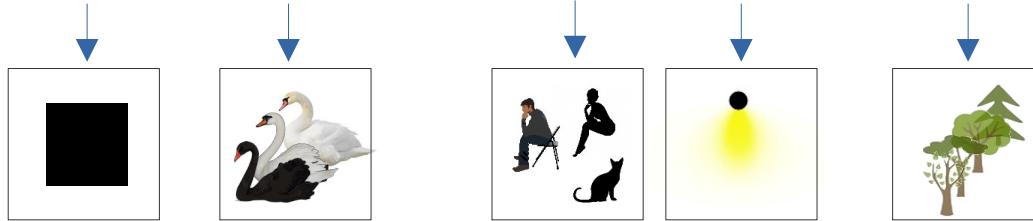

PERCEPTUAL GROUNDING

- Language understanding requires associating language with perceptual representations

PERCEPTUAL GROUNDING

- Language understanding requires associating language with perceptual representations

the black swan that sits below a tree

GOAL

- Towards a neural process model that perceptually grounds language

AMBITIOUSNESS OF THE PROJECT

- Modeling the perceptual grounding of language in general is an ambitious project

AMBITIOUSNESS OF THE PROJECT

- Modeling the perceptual grounding of language in general is an ambitious project
 - Many words refer to abstract concepts
 - Not clear how those could be characterized perceptually

AMBITIOUSNESS OF THE PROJECT

- Modeling the perceptual grounding of language in general is an ambitious project
 - Many words refer to abstract concepts
 - Not clear how those could be characterized perceptually
 - There is a wide range of grammatical constructions that can be combined in a wide number of ways

AMBITIOUSNESS OF THE PROJECT

- Modeling the perceptual grounding of language in general is an ambitious project
 - Many words refer to abstract concepts
 - Not clear how those could be characterized perceptually
 - There is a wide range of grammatical constructions that can be combined in a wide number of ways
- Need to approach this in small steps

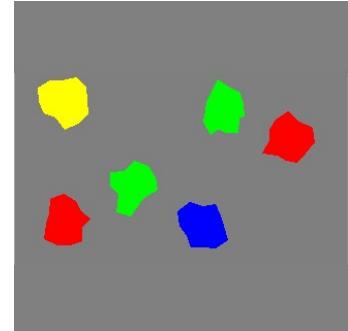

DFT MODELS OF LANGUAGE GROUNDING

- Today: Simple visuo-spatial language grounding

- e.g., “the red to the right of the green”
 - Lipinski et al. (2012), Richter et al. (2014)

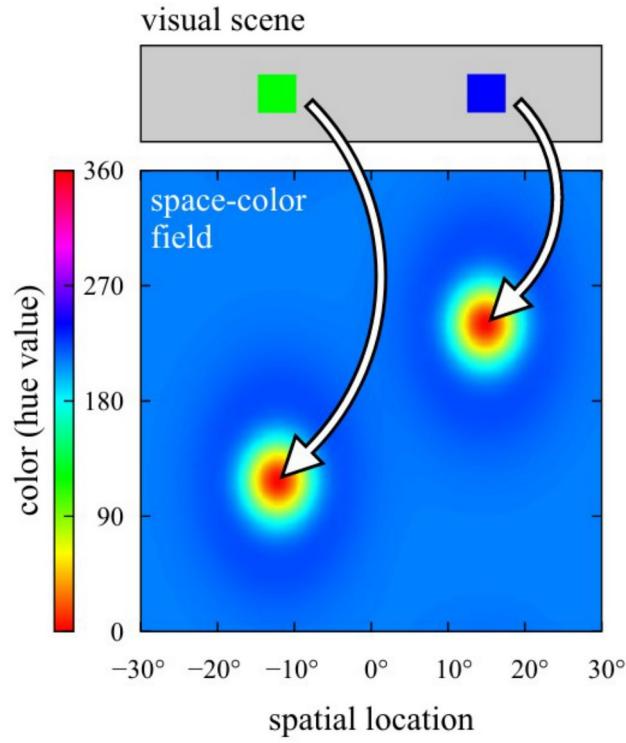

- Outlook:

- Movement relations
 - e.g., “the red that moves towards the green”
 - Richter, Lins, & Schöner (2021)
 - Compositional visuo-spatial language grounding
 - e.g., “the red ball that moves towards the big tree, which is to the left of the lake and to the right of the house”
 - Sabinasz & Schöner (2021)

Preliminaries

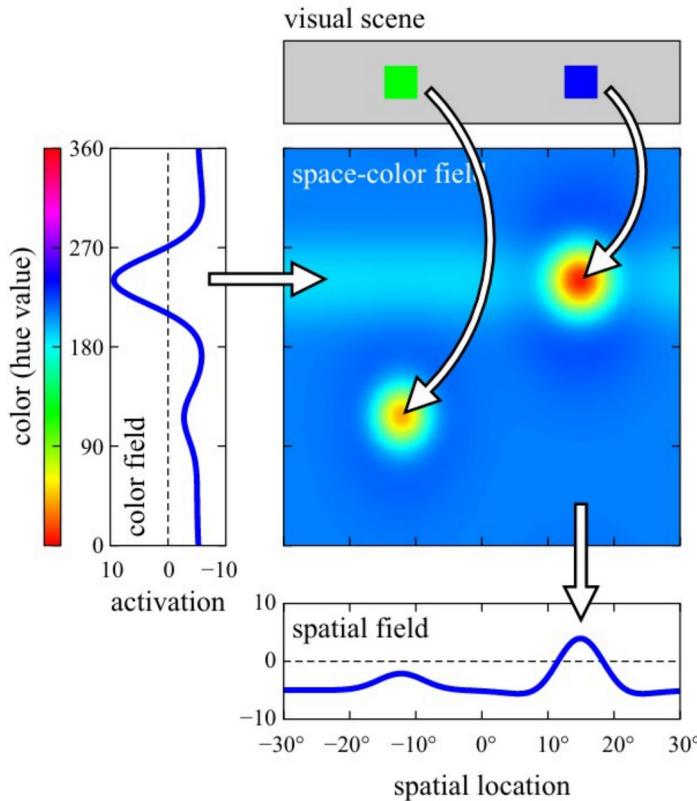

- Higher-dimensional fields enable binding dimensions

(Schneegans et al., 2016a)

Preliminaries

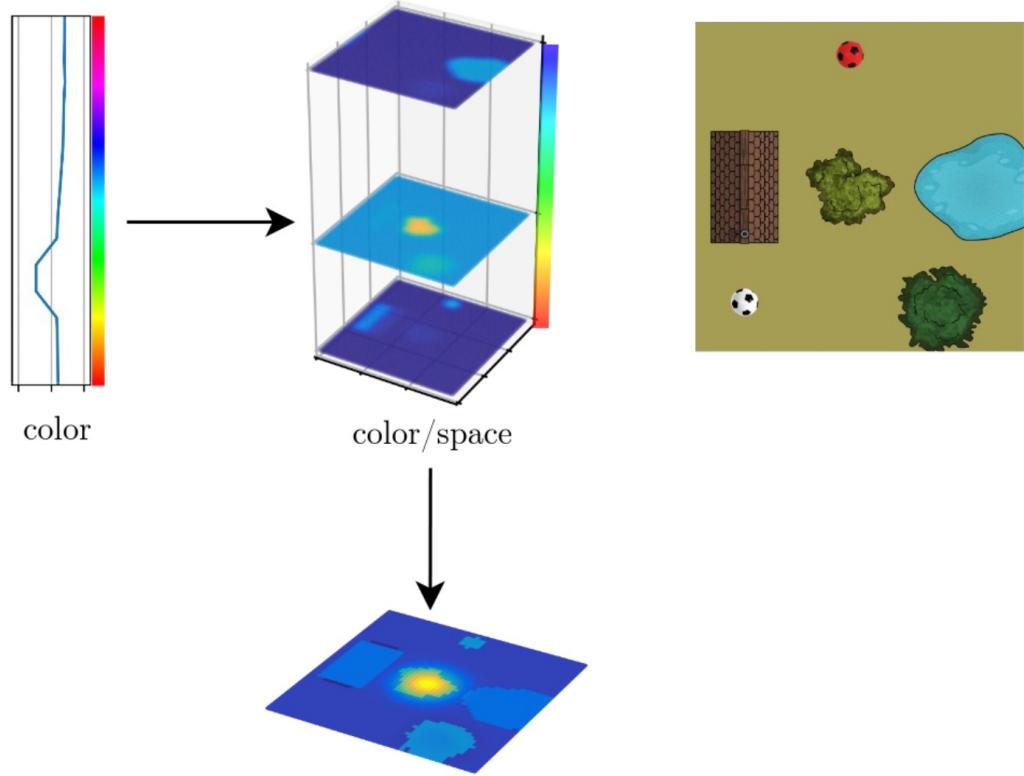

- Ridge input along one dimension can be used to extract bound information

(Schneegans et al., 2016a)

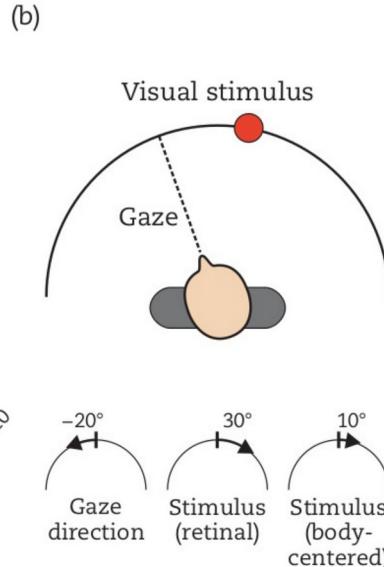

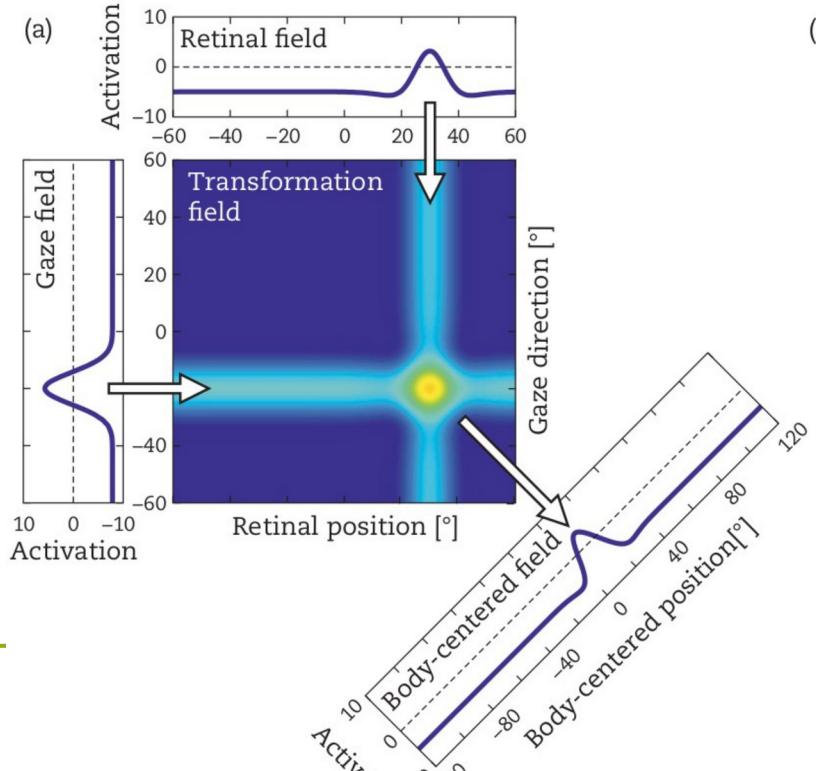

Preliminaries

- Ridge input along one dimension can be used to extract bound information

Preliminaries

- Transformation fields enable transforming spatial locations into a different coordinate system

Preliminaries

- Evidence for neurons in the parietal cortex that have the response properties of transformation fields (Andersen and Mountcastle 1983; Andersen et al. 1985)
- Further evidence for the model (Schneegans & Schöner, 2012)

Lipinski et al., 2012

- Cognitive architecture for grounding simple spatial language

SPATIAL COMPARISON

- Compare two objects w.r.t. their spatial relation
- “Where is the green object relative to the red object?” → to the right

SPATIAL COMPARISON: REQUIRED OPERATIONS

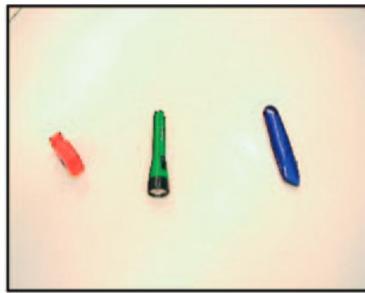

(Following a computational analysis by Logan & Sadler, 1996)

- Spatial indexing: bind objects in the perceptual input to target and reference roles
 - “Where is **the green object** relative to **the red object**? ”

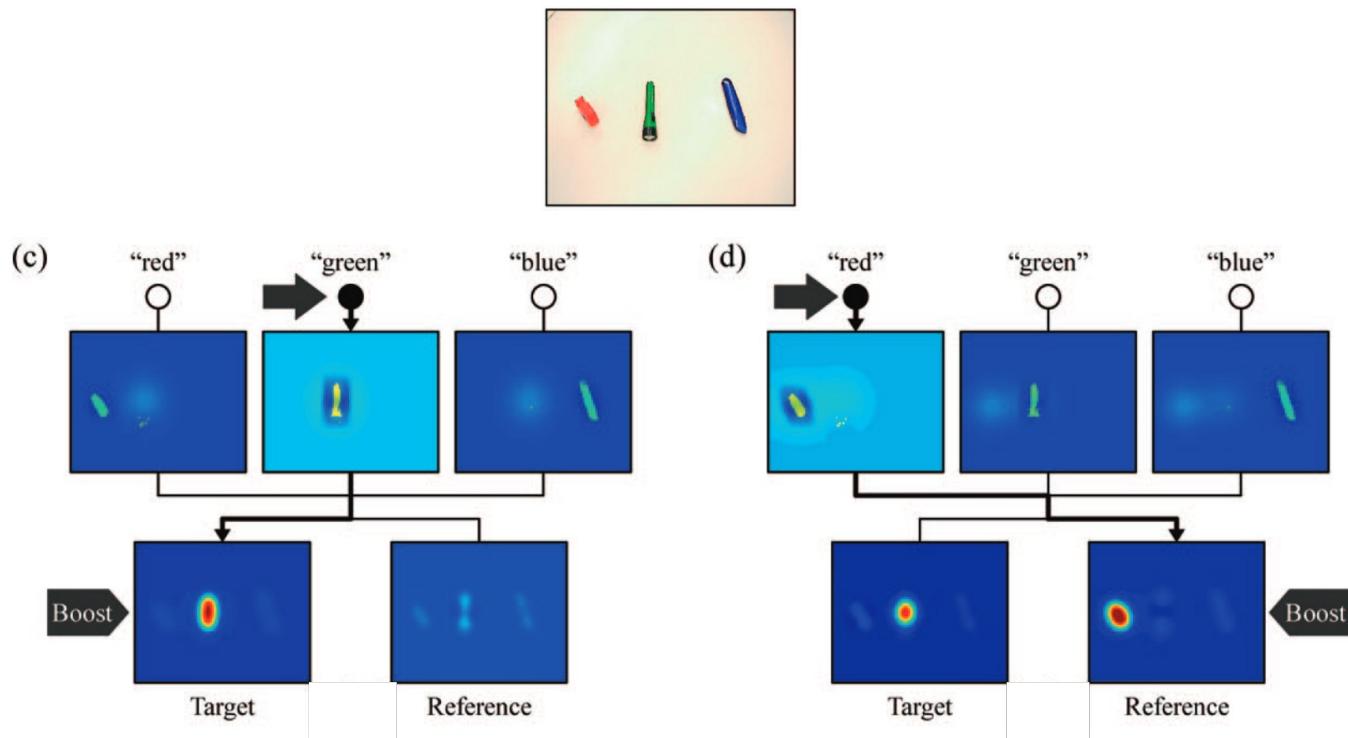

target

reference

- Alignment of reference frame with reference object (coordinate transformation)
 - Compare that relative position to spatial templates that represent regions of acceptability

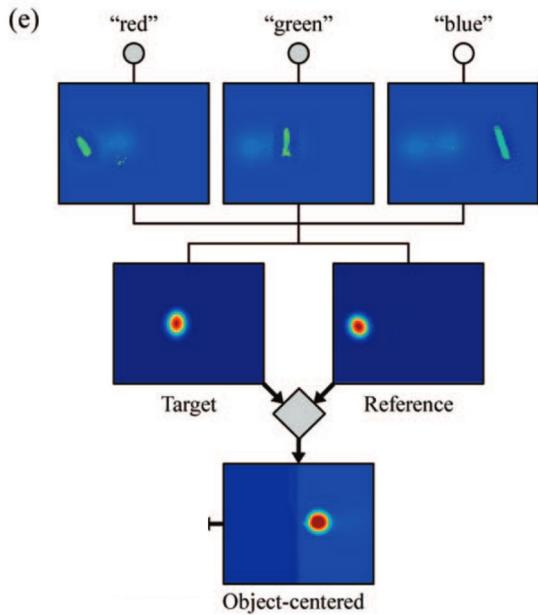

FINDING OBJECTS IN THE PERCEPTUAL INPUT

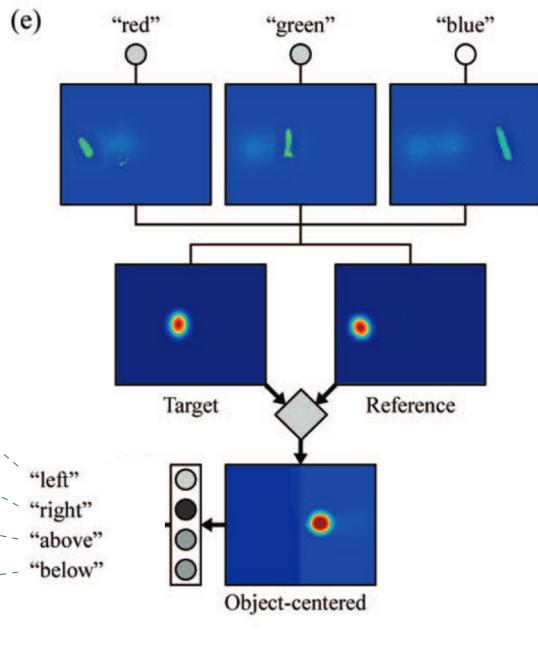

COORDINATE TRANSFORMATION

COMPARING TO A SPATIAL TEMPLATE

- “Where is the green object relative to the red object?”

COMPARING TO A SPATIAL TEMPLATE

- Activation of the spatial relation nodes predict human acceptability ratings for spatial terms for a wide range of conditions

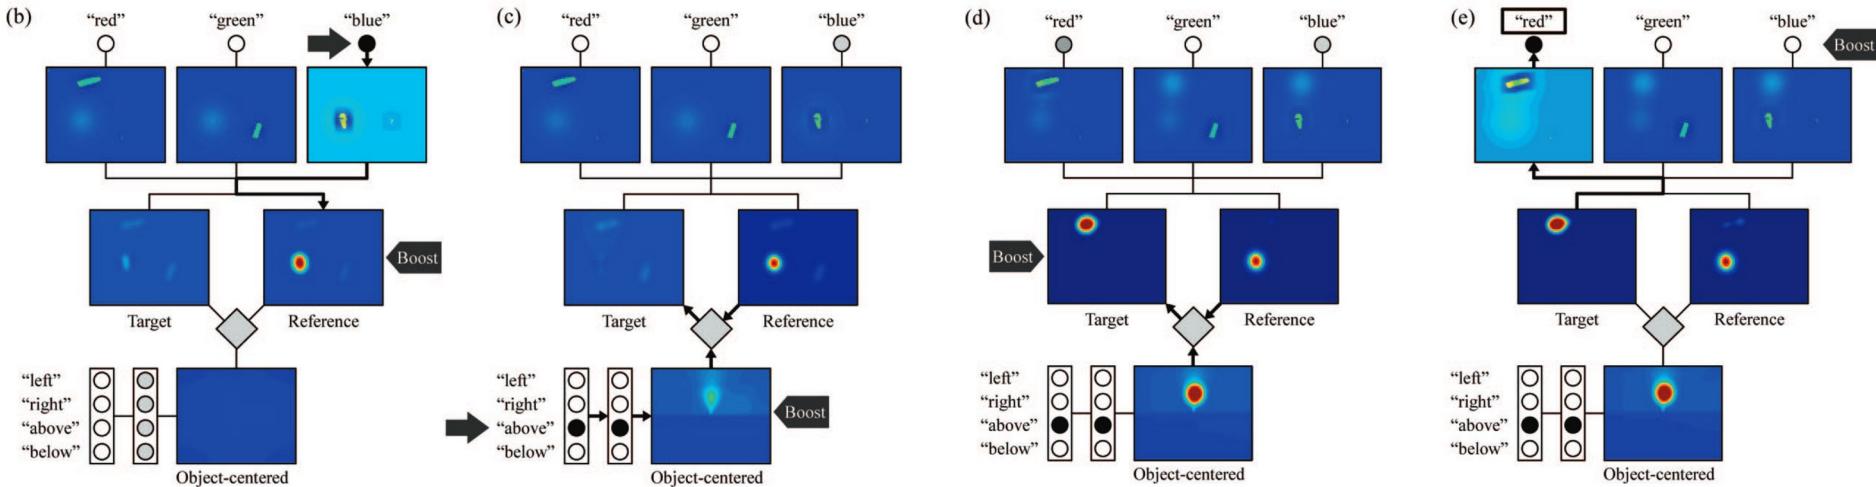

TARGET IDENTIFICATION

- Find an object which bears a given relation to a given reference object
- “Which object is above the blue object?”

TARGET IDENTIFICATION

- “Which object is above the blue object?”

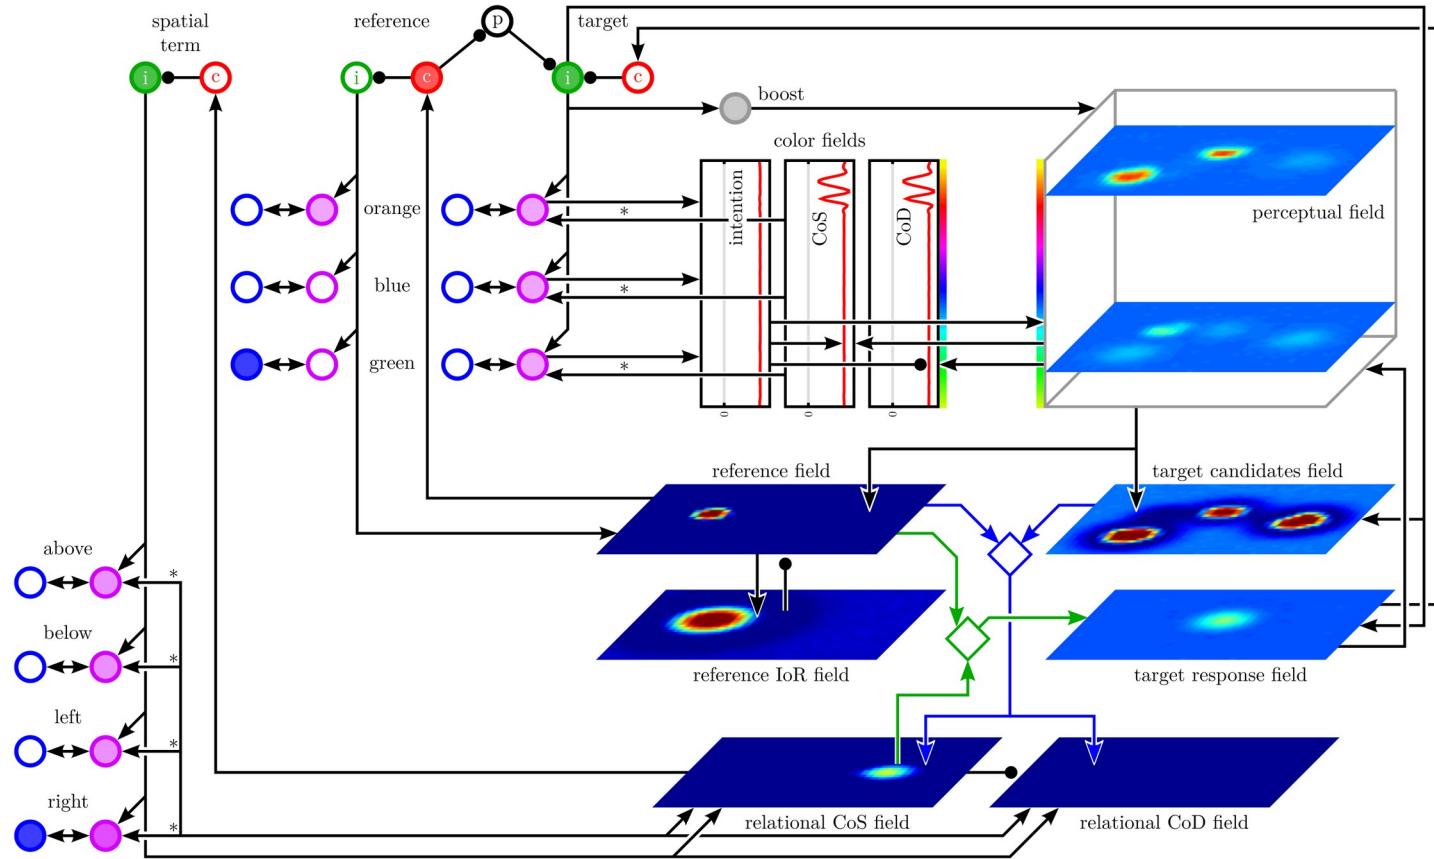

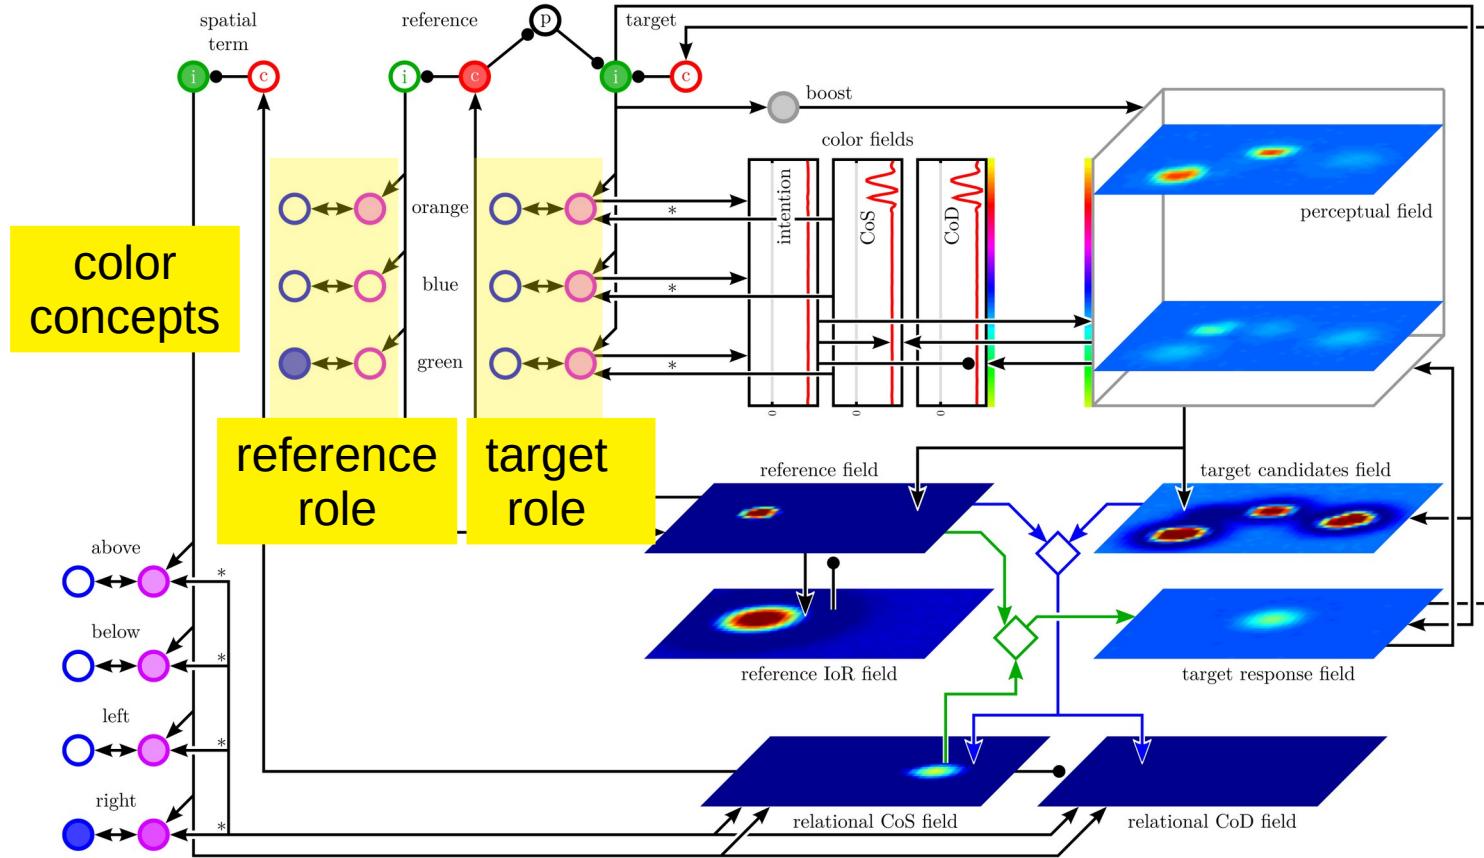

GROUNDING

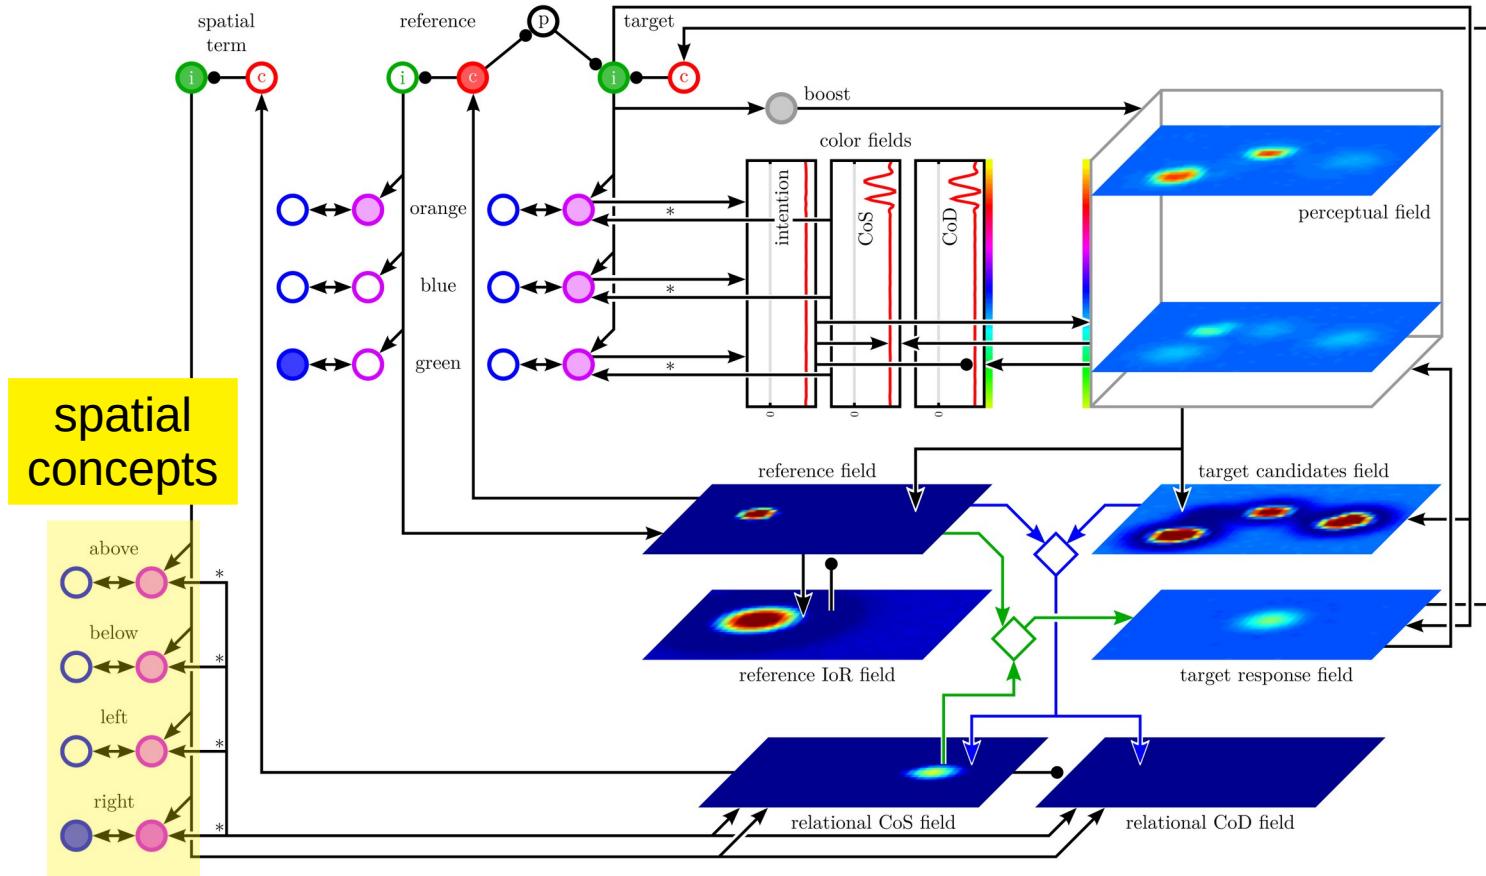

- Grounding a phrase which describes an object: finding the described object in the visual input
- e.g., “the red object to the left of the green object”
- Requires hypothesis testing

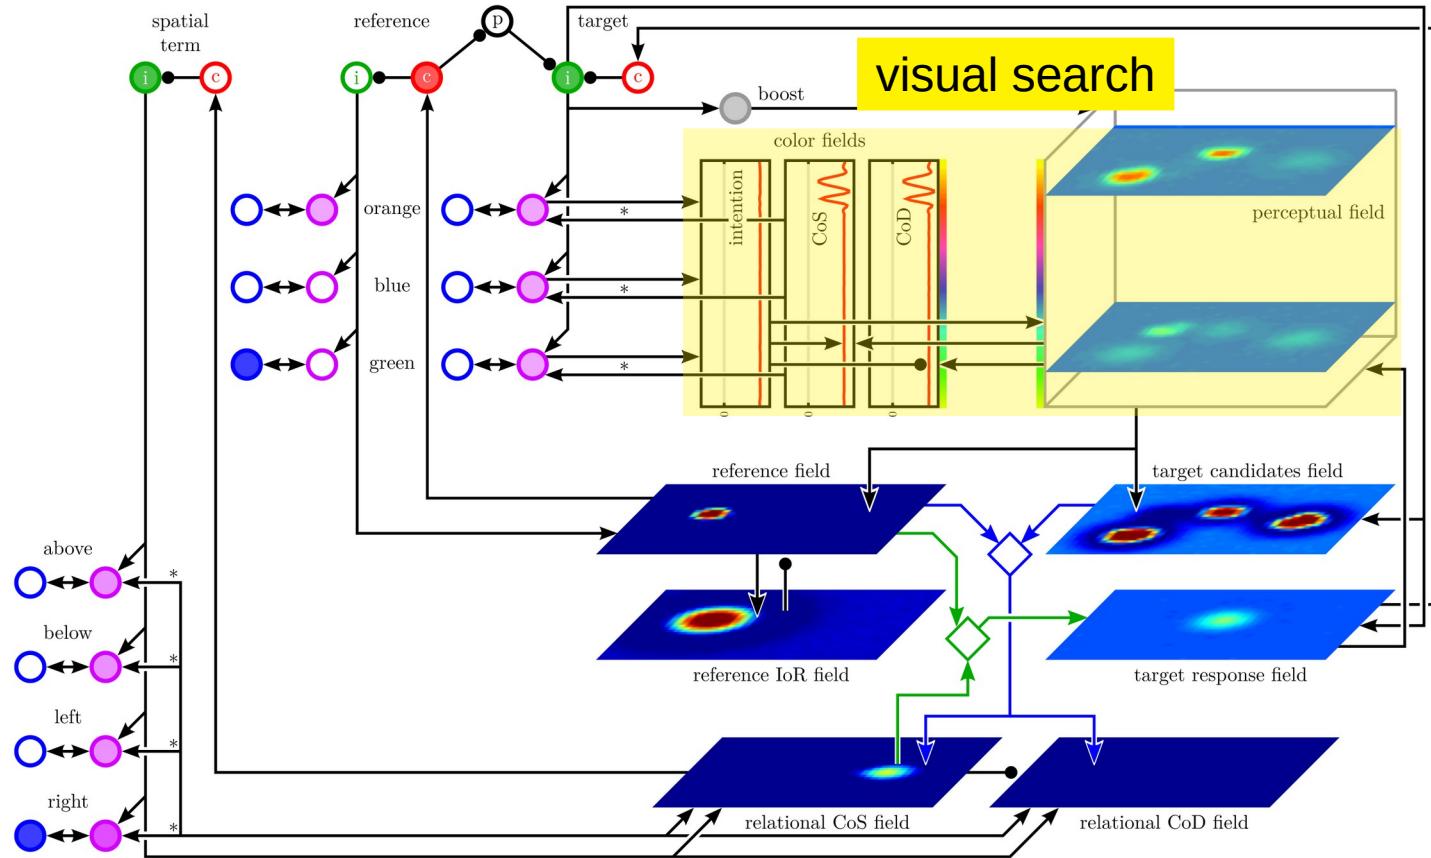

- Another desideratum: Autonomy

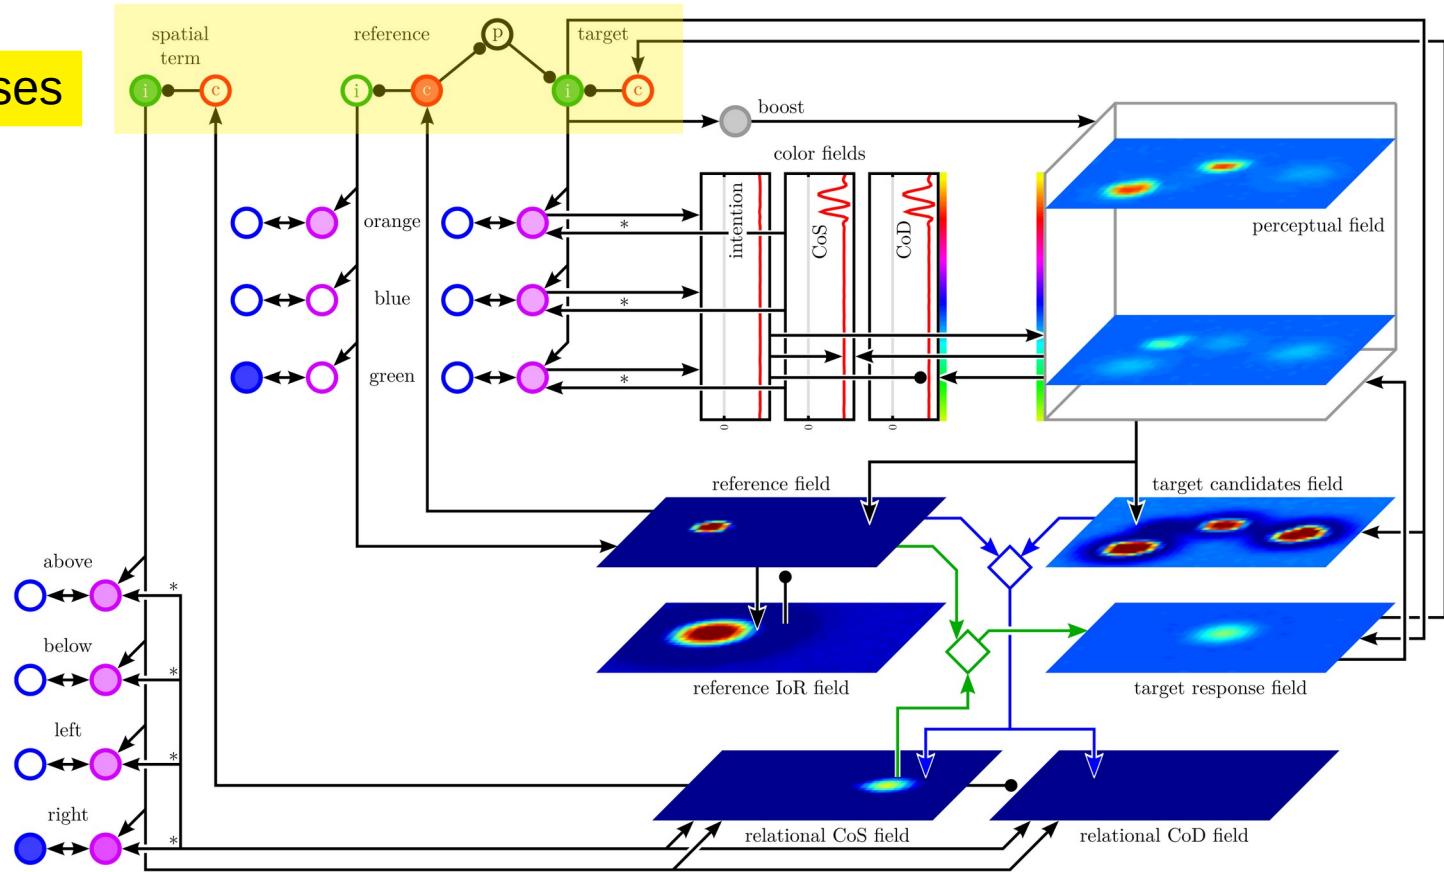

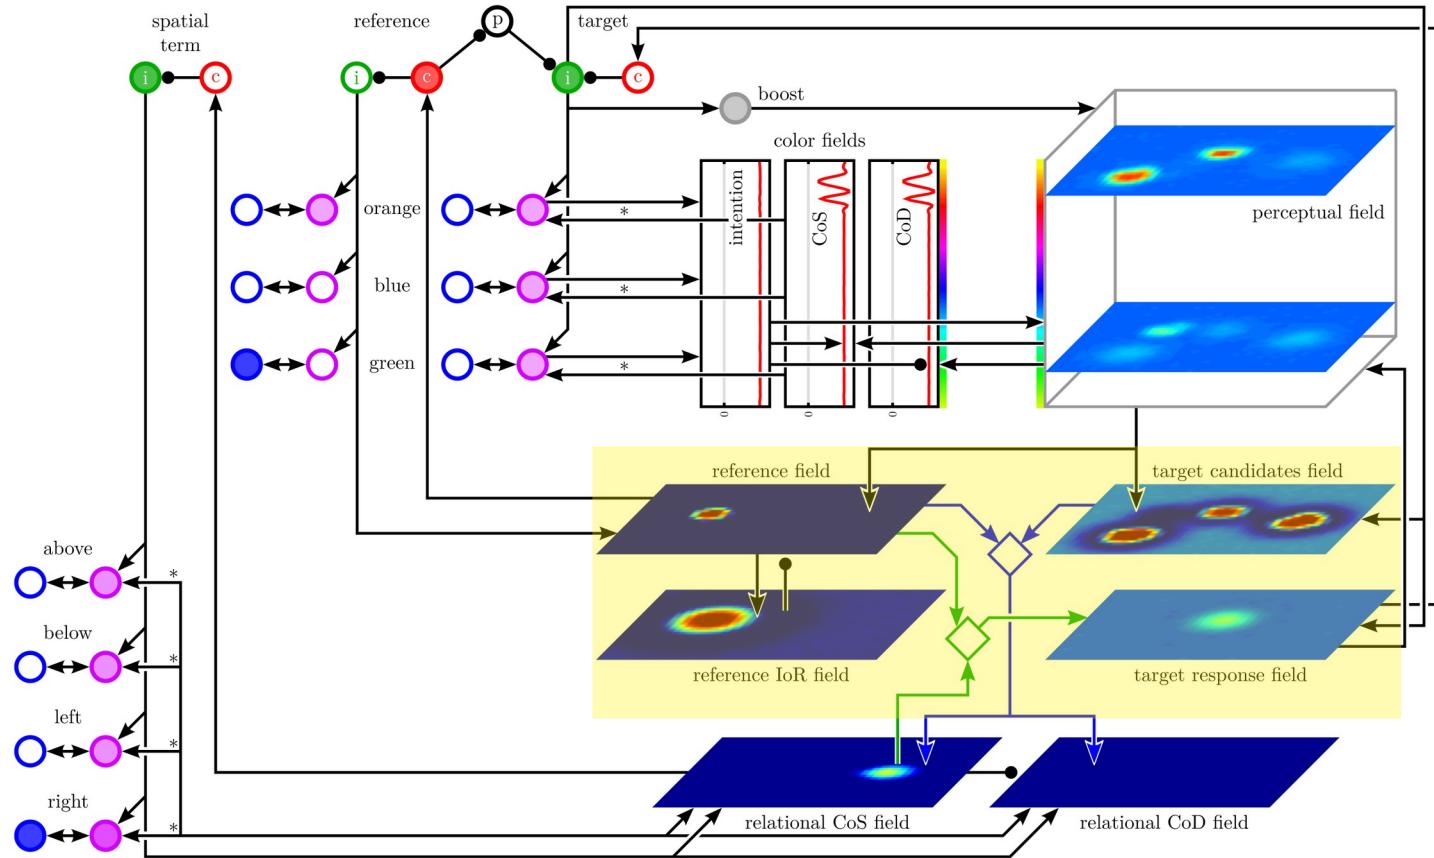

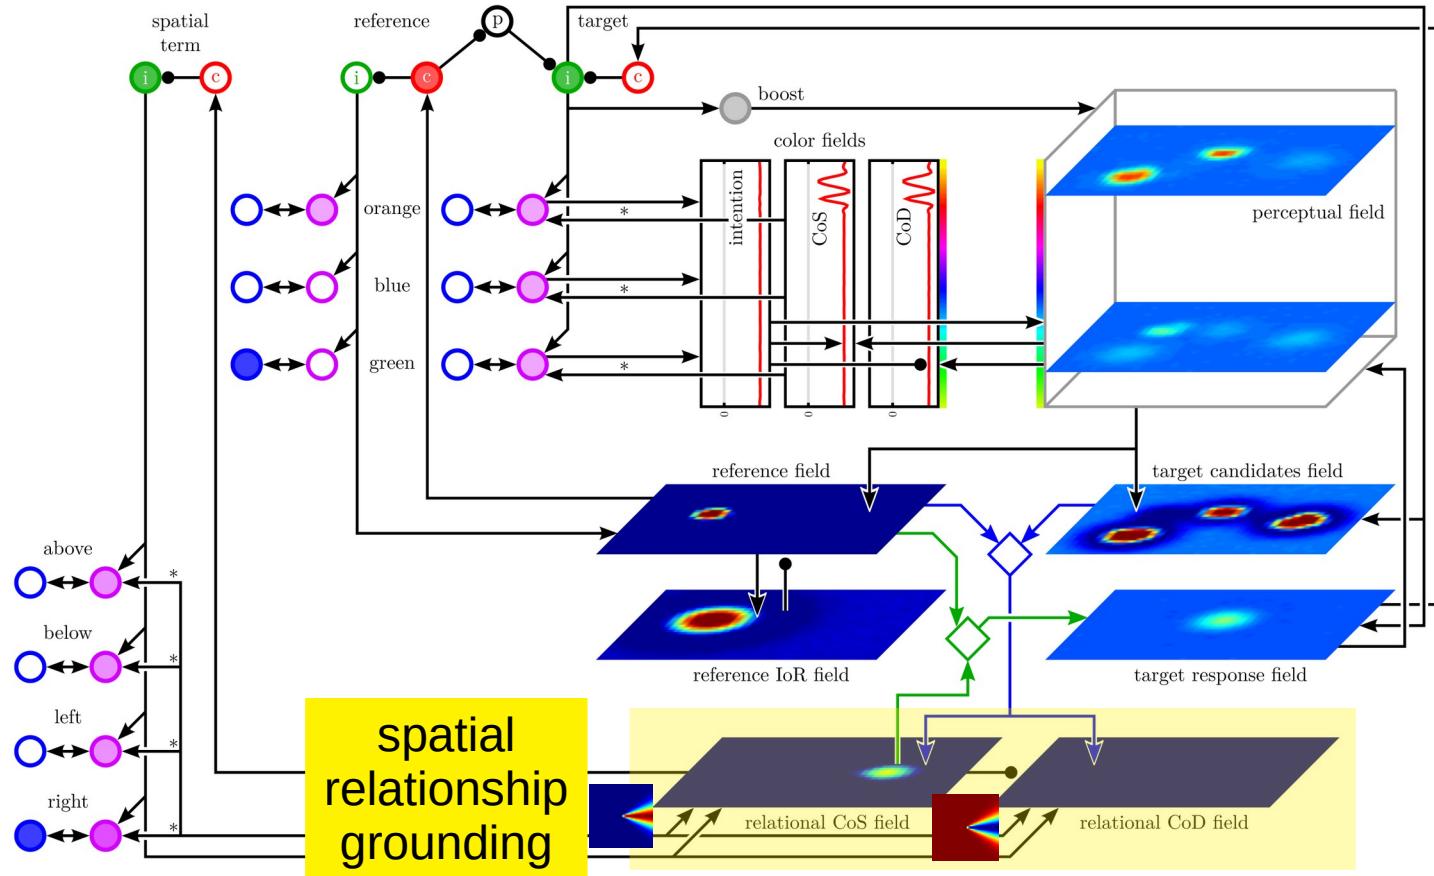

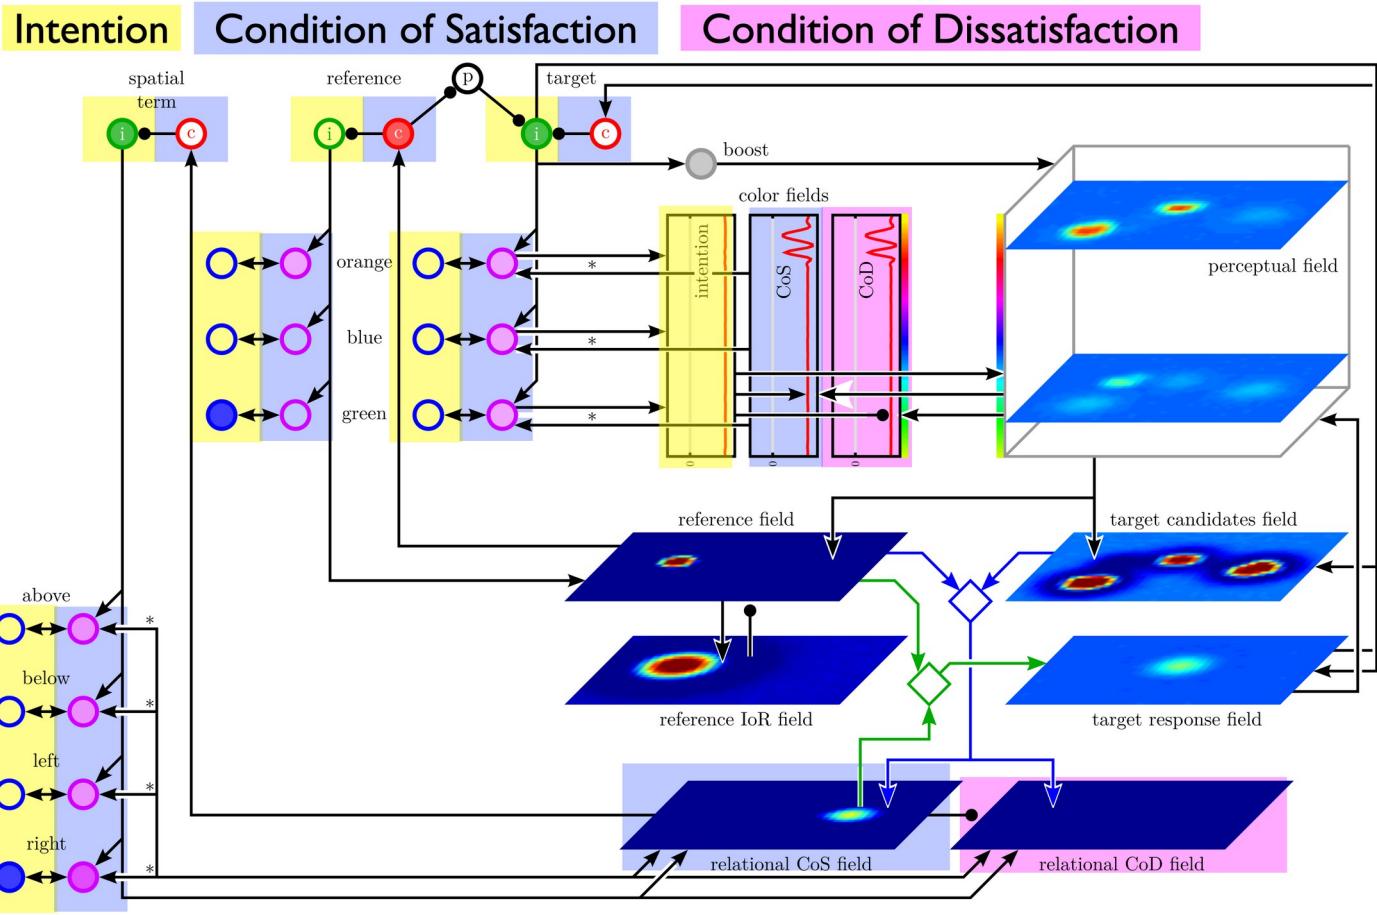

processes

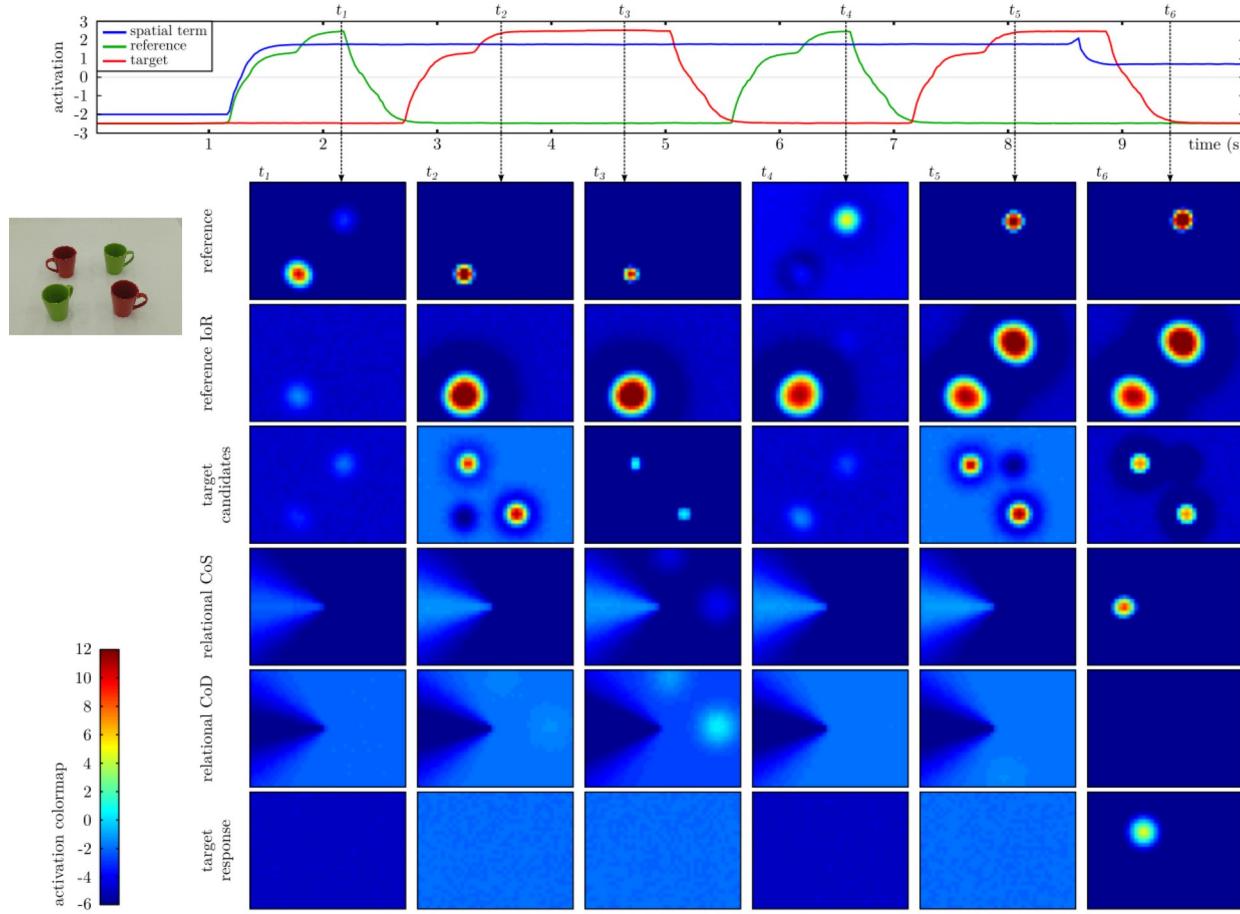

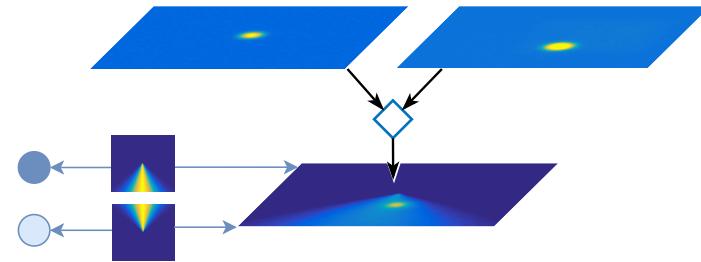

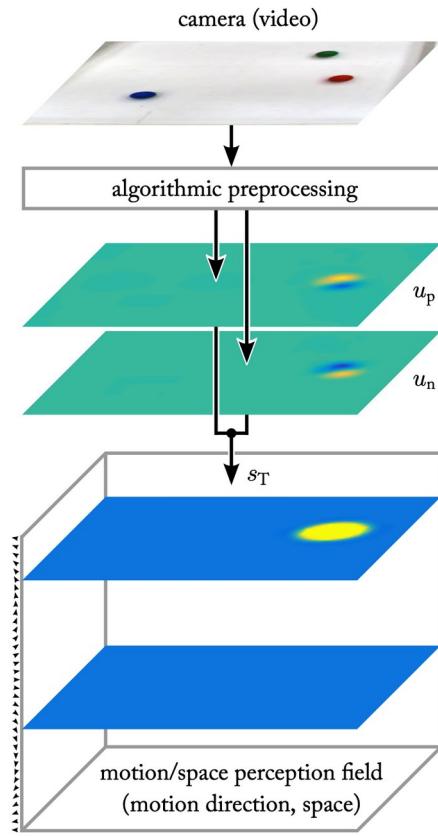

EXAMPLE

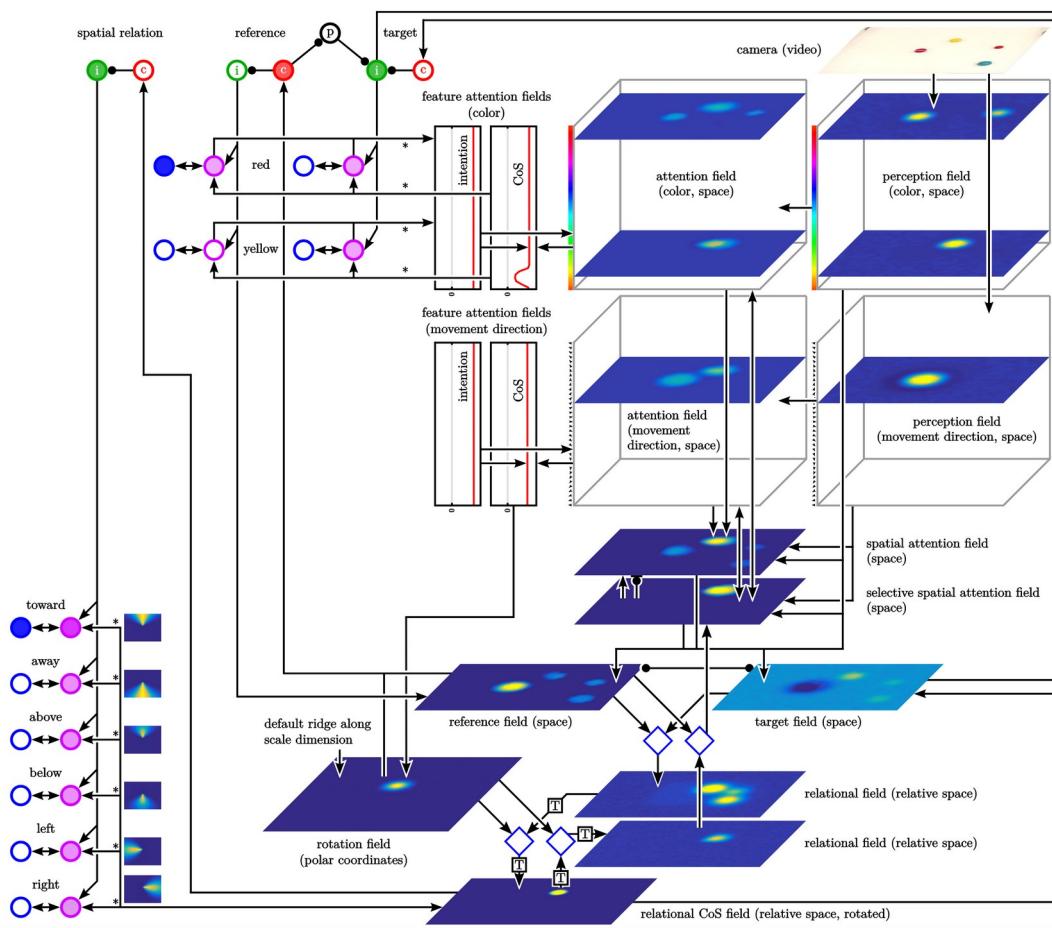

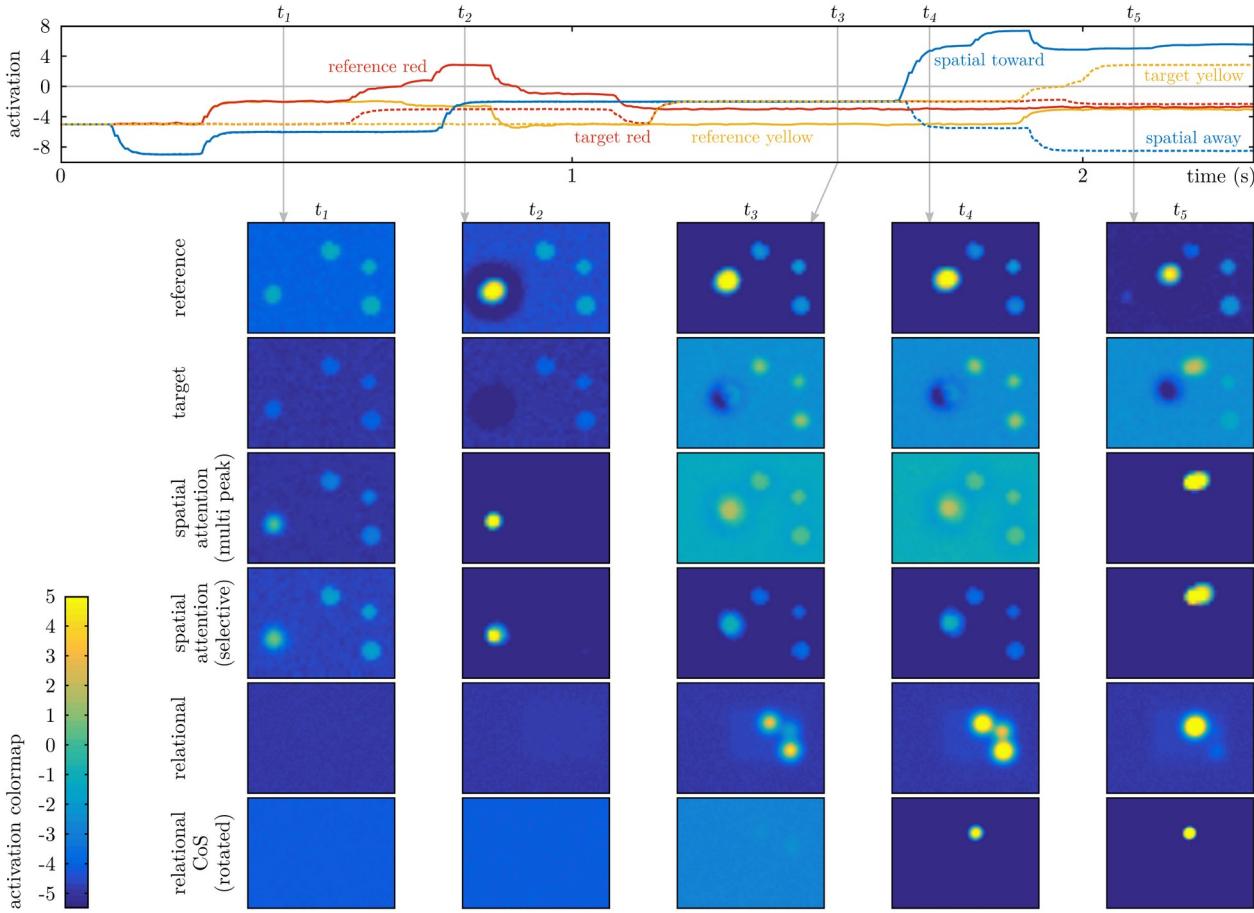

“The red object to the left of the green object”

MOVEMENT RELATIONS

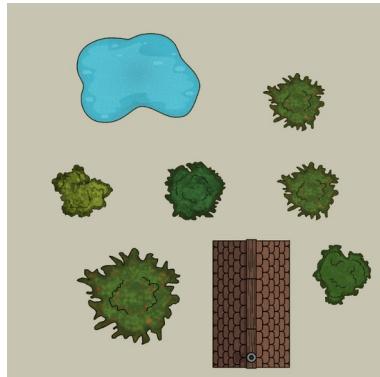

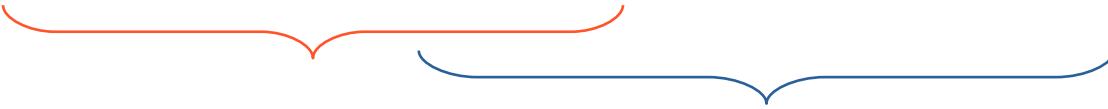

TOWARDS COMPOSITIONALITY

- the tree to the right of the tree below the lake
- the tree below the lake and above the house
- the red ball that moves towards the big tree, which is to the left of the lake and to the right of the house

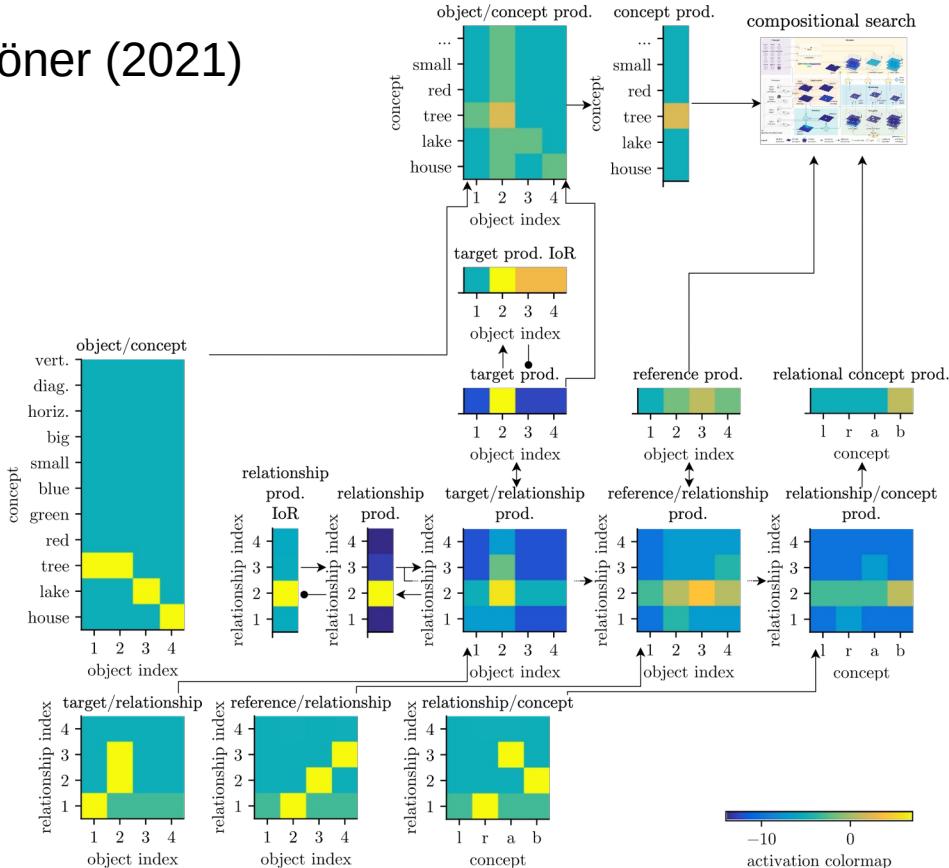

TOWARDS COMPOSITIONALITY

- The massiveness of the binding problem:
e.g., "the lake above the tree above the house"

- The problem of 2:
e.g., "the small tree above the big tree"

TOWARDS COMPOSITIONALITY
